

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

Description of type (coll. Am. Mus. No. 59,051, female, Princetown, Trinidad, March 28, 1893, F. M. Chapman).—Crown and nape cinereous washed with olive green, back bright olive green, wings and tail fuscous, the exposed margins of the feathers olive green; auriculars cinereous, throat and upper part of the breast pale grayish white, rest of the under parts bright yellow; bill horn-black, feet brownish black; wing, 2.40; tail, 2.25; exposed culmen, .50; height of bill at anterior margin of the nostril, .22 in.

***Basileuterus vermivorus olivascens* subsp. nov.**

Char. Subsp.—Similar to *B. vermivorus* (Vieill.) but the bill averages larger and the upper parts are constantly grayer. (Type, coll. Am. Mus. No. 58,974, adult male, Princetown, Trinidad, March 1, 1893, F. M. Chapman.)

***Myrmeciza longipes albiventris* subsp. nov.**

Char. subsp.—Similar to *M. longipes* (Swains.), but somewhat smaller and with the flanks and abdomen pure white, slightly or not at all washed with cinereous. (Type, coll. Am. Mus. No. 59,329, adult male, Princetown, Trinidad, March 10, 1893, F. M. Chapman.)

RECENT LITERATURE.

Shufeldt on Fossil Birds from Oregon.—In a quarto memoir¹ of thirty-five pages, with three plates, Dr. Shufeldt gives the final results of his studies of several hundred fossil bones of birds, collected at Fossil and Silver Lakes, Oregon, by Professors Thomas Condon and E. D. Cope, of which a preliminary account was given in the 'American Naturalist' for April, 1891 (pp. 359-362). "The Silver Lake Region of Oregon is considered to be of the latest Tertiary formation of the horizon known as the *Equus* Beds." About 50 species were recognized, of which 27 are positively identified with species still existing in the region, 5 as probably identical with living species, and 17 as extinct, as follows:—

¹ A Study of the Fossil Avifauna of the *Equus* Beds of the Oregon Desert. By R. W. Shufeldt, M. D. Journ. Acad. Nat. Sci. Phila., Vol. XI, pp. 389 425, pls. xv-xvii, 1892.

Existing Species.

<i>Æchmophorus occidentalis</i>	<i>Anas cyanoptera?</i>
<i>Colymbus holboëlli</i>	<i>Spatula clypeata</i>
<i>Colymbus auritus</i>	<i>Dafila acuta</i>
<i>Podilymbus podiceps</i>	<i>Aix sponsa</i>
<i>Larus argentatus smithsonianus</i>	<i>Aythya marila nearctica?</i>
<i>Larus californicus?</i>	<i>Glaucionetta islandica</i>
<i>Larus philadelphia</i>	<i>Clangula hyemalis</i>
<i>Xema sabinii</i>	<i>Branta canadensis</i>
<i>Sterna elegans?</i>	<i>Anser albifrons gambeli</i>
<i>Sterna forsteri?</i>	<i>Chen hyperborea</i>
<i>Hydrochelidon nigra surinamensis</i>	<i>Fulica americana</i>
<i>Pelecanus erythrorhynchos</i>	<i>Phalaropus lobatus</i>
<i>Lophodytes cucullatus</i>	<i>Tympanuchus pallidicinctus</i>
<i>Anas boschas</i>	<i>Pediocætes phasianellus columbi-</i>
<i>Anas americana</i>	<i>anus.</i>
<i>Anas carolinensis</i>	<i>Bubo virginianus.</i>
<i>Anas discors</i>	

Extinct Species.

<i>Larus robustus</i> , sp. nov.	<i>Fulica minor</i> , sp. nov.
<i>Larus oregonus</i> , sp. nov.	<i>Pediocætes lucasi</i> , sp. nov.
<i>Phalacrocorax macropus</i> (<i>Cope</i>)	<i>Pediocætes nanus</i> , sp. nov.
<i>Anser condoni</i> , sp. nov.	<i>Palæotetrix gilli</i> , gen. et sp. nov.
<i>Branta hypsibatus</i> <i>Cope</i>	<i>Aquila pliogryps</i> , sp. nov.
<i>Branta propinqua</i> , sp. nov.	<i>Aquila sodalis</i> , sp. nov.
<i>Olor paloregonus</i> (<i>Cope</i>)	<i>Scolocophagus affinis</i> , sp. nov.
<i>Phœnicopterus copei</i> , sp. nov.	<i>Corvus annectens</i> , sp. nov.
<i>Ardea paloccidentalis</i> , sp. nov.	

It thus appears that the bird life of this region in Pliocene time was not so very different from that of the same area today. As Dr. Shufeldt observes: "Great flocks of Swans, Geese and Ducks were there, feeding on the marshy shores of the lake or disporting themselves upon its waters. With but few exceptions they were of modern genera and species. A ponderous Goose appeared among them, perhaps but sparingly during Pliocene time, for it must have been nearly extinct. And a Swan, too, whose race has since died out was also there, but it was of a size quite in keeping with present day Swans. . . . To these groups we must add many individuals of a species of a great, strange Cormorant (*P. macropus*), larger than any of our existing Comorants. . . . But the strangest figure upon the scene among the birds was a true Flamingo. It could not have been very abundant, for it has left but scanty remains. Still it was there, and its presence has its meaning, — it may even suggest ideas

as to what the climate may have been in those times. . . . To speak again of the climate, it might well be compared with the present climate of Florida and the lower part of Louisiana, with the vegetation fully as luxuriant as it is now in those parts and with the palms more abundantly represented."

Dr. Shufeldt's memoir is thus a very interesting and important contribution to the early history of bird life in North America. Although he has fortunately had a comparatively large amount of material for examination, the field is obviously not exhausted, so that much may be hoped from further exploration of even this same region.—J. A. A.

Shufeldt on Ichthyornis, and on the Classification of the Longipennes.

—In a paper entitled 'Comparative Osteological Notes on the Extinct Bird *Ichthyornis*'¹ Dr. Shufeldt reaches the conclusion that this type, while resembling in many points the Gulls and Terns, shared more characters in common with the Skimmers. Much of the paper is, in fact, given up to a discussion of the relationship of the Skimmers (*Rhynchopidae*) to the *Laridæ*, reaching the conclusion that while the Gulls and Terns gradually approach each other, through such forms as *Xema*, *Creagrus*, and *Gelochelidon*, as long since stated by Coues, the Skimmers are sharply separated from either, and are well entitled to the rank of a distinct family, as placed in the A. O. U. Check-List. In a later paper² he returns to the subject, and after reviewing various previous classifications of the group, proposes that already adopted in the A. O. U. Check-List as best agreeing with his extended osteological studies of the North American forms.—J. A. A.

The Affinities of Hummingbirds and Swifts.—The pros and cons of the relationship of Hummingbirds and Swifts have recently been presented in various more or less controversial papers on the subject by Dr. Shufeldt³ and Messrs. Ridgway⁴ and Lucas.⁵ As is well known, Dr.
